This page hosts the documentation for TissUUmaps 3.0. You can find a pdf version of this documentation here.

For more information on the TissUUmaps project, including video tutorials and demos, visit our website: https://tissuumaps.github.io.

Work in progress!

This page is mostly empty for now. We are working actively on writing this documentation, more content will be available soon!

CONTENTS: 1

CHAPTER

ONE

INTRODUCTION

1.1 About TissUUmaps

TissUUmaps is a free and open source browser-based tool for GPU-accelerated visualization and interactive exploration of tens of millions of datapoints overlaying tissue samples. Users can visualize markers and regions, explore spatial statistics and quantitative analyses of tissue morphology, and assess the quality of decoding in situ transcriptomics data. TissUUmaps provides instant multi-resolution image viewing, can be customized, shared, and also integrated in Jupyter Notebooks. We envision TissUUmaps to contribute to broader dissemination and flexible sharing of large-scale spatial omics data.

Currently, microscopy data can be cumbersome to share: physically transferring the images is often necessary and dedicated software must be installed. Instead, researchers can now share their findings with a simple link to a website running TissUUmaps. The images are loaded in real time, together with annotations, markers, and masks that may also be modified by the user. We also provide tools for quality control and image processing. The software is designed to display and interact with images at multiple resolutions and large numbers of markers, especially data from spatially resolved omics techniques and tissue atlases. TissUUmaps is compatible with many different bioimage informatics tools, and provides new ways to develop insights when exploring and sharing data.

You can access the TissUUmaps project gallery with interactive examples to explore data from in situ sequencing and spatial transcriptomics experiments and view localized quantification of cell and tissue morphology, including links to publications. For seeing examples of TissUUmaps compatibility with other platforms you can access the tutorials page.

1.2 Installation

TissUUmaps is a browser-based tool for fast visualization and exploration of millions of data points overlaying a tissue sample. TissUUmaps can be used as a web service or locally in your computer, and allows users to share regions of interest and local statistics.

1.2.1 Windows installation

1. Download the Windows Installer from the last release and install it. Note that the installer is not signed yet and may trigger warnings from the browser and from the firewall. You can safely pass these warnings.

1.2.2 PIP installation (for Linux and Mac)

1. Install libvips for your system: https://www.libvips.org/install.html

An easy way to install libvips is to use an Anaconda environment with libvips:

```
conda create -y -n tissuumaps_env -c conda-forge python=3.9 libvips conda activate tissuumaps_env
```

2. Install the TissUUmaps library using pip:

```
pip install "TissUUmaps[full]"
```

3. Start the TissUUmaps user interface:

```
tissuumaps
```

4. Or start TissUUmaps as a local server:

```
tissuumaps_server path_to_your_images
```

And open http://127.0.0.1:5000/ in your favorite browser.

1.3 Citing TissUUmaps

Please cite our preprint on bioRxiv if using TissUUmaps in your work:

TissUUmaps 3: Interactive visualization and quality assessment of large-scale spatial omics data. *Nicolas Pielawski, Axel Andersson, Christophe Avenel, Andrea Behanova, Eduard Chelebian, Anna Klemm, Fredrik Nysjö, Leslie Solorzano, Carolina Wählby,* bioRxiv 2022.01.28.478131; doi: https://doi.org/10.1101/2022.01.28.478131.

1.4 Changelog

1.4.1 3.0.8.6

- Make it possible to update to newer version of plugins
- Fully support -debug option in command line
- Add tooltip title for piecharts
- Add documentation https://tissuumaps.github.io/TissUUmaps-docs/
- Fix marker picking when pixel ratio != 1
- Other minor fixes and cleaning

1.4.2 3.0.8.5

· Minor fixes.

1.4.3 3.0.8.4

- Add tiling to viewport capture for higher resolution output
- · Increase resolution of markers on high resolution devices
- Fix jumps on pan with mouse gesture (mobile)
- · Add fix for bright image canvas on Safari
- Add an option to remove markers' outlines.

1.4.4 3.0.8.3

• Fix png artifact in Firefox, by generating jpg tiles.

1.4.5 3.0.8.2

• Add high resolution capture of viewport, up to 4096x4096 pixels.

1.4.6 3.0.8.1

• Fix multiple dataset alignment when no background image

1.4.7 3.0.8

- Fix black images generated by VIPS
- Fix Linux and Mac open of captures
- Auto save datasets as buttons when saving tmap projects
- Add mpp (microns per pixel) option in tmap files, to add scale bar to viewer
- Make region line thickness depend on zoom level
- · Add compatibility with JupyterLab
- Add opacity per marker option

1.4.8 3.0.7

• Add menu to load plugins through an update-site

1.4. Changelog 4

1.4.9 3.0.6

- Fix multiple plugins opening always last plugin
- Move to OpenSeadragon 3.0.0
- Add tooltip format in Advanced Settings
- Add drag and drop to open CSV files and images
- Add "Add layer" button for flask version
- Add viewport capture

1.4.10 3.0.5

• Move csv loading to Papa Parse streaming, to allow better memory management

1.4.11 3.0.4

• Add filtering of markers

1.4.12 3.0

• Add tissuumaps.jupyter module

1.4. Changelog 5

GETTING STARTED

2.1 Images

2.1.1 Supported image formats

TissUUmaps can read whole slide images in any format recognized by the OpenSlide library:

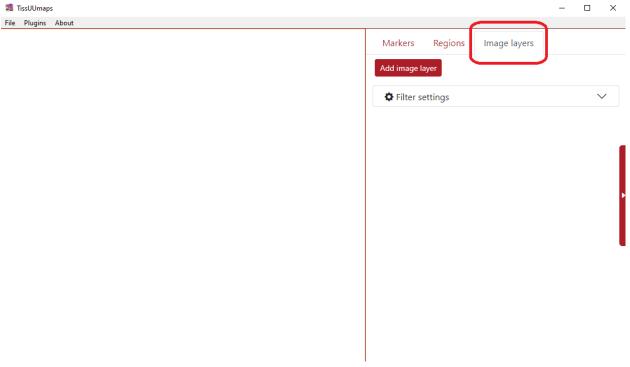

- Aperio (.svs, .tif)
- Hamamatsu (.ndpi, .vms, .vmu)
- Leica (.scn)
- MIRAX (.mrxs)
- Philips (.tiff)
- Sakura (.svslide)
- Trestle (.tif)
- Ventana (.bif, .tif)
- Generic tiled TIFF (.tif)

 $Tiss UU maps \ will \ automatically \ convert \ any \ other \ format \ into \ a \ pyramidal \ tiff \ (in \ a \ temporary \ .tissuumaps \ folder) \ created \ in the \ original \ image \ folder) \ using \ vips.$

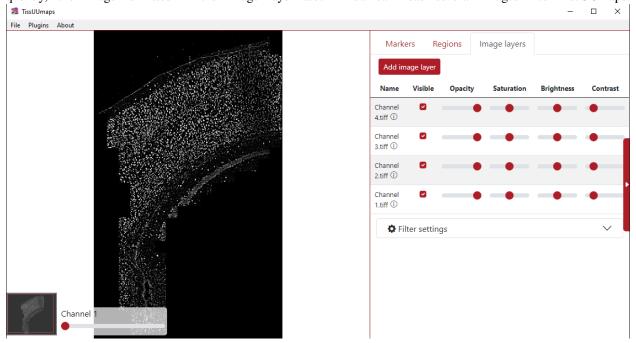

If your image fails to open, try converting it to tif format using an external tool.

2.1.2 Load images

You can load the images when you select the Image layer tab as you can see in the figure below:

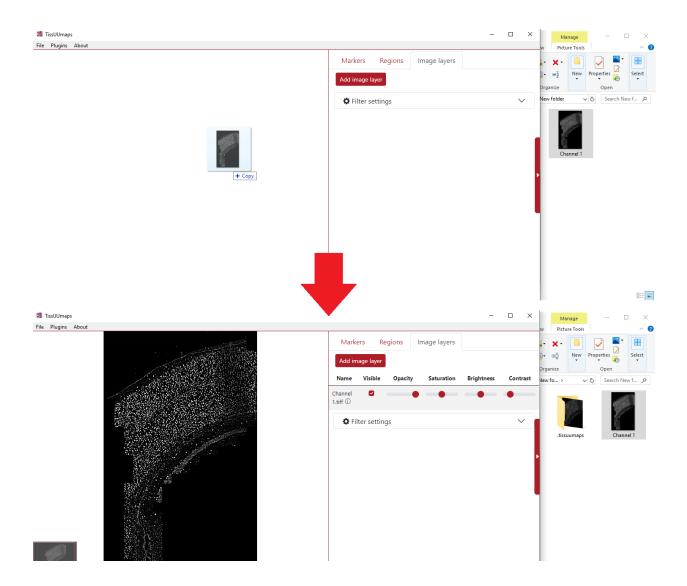

Then click the button Add image layer and select the desired image from your computer. Subsequently, the image is listed in the Image layer tab. You can load several images into TissUUmaps.

You can also drag and drop the image from file explorer into TissUUmaps.

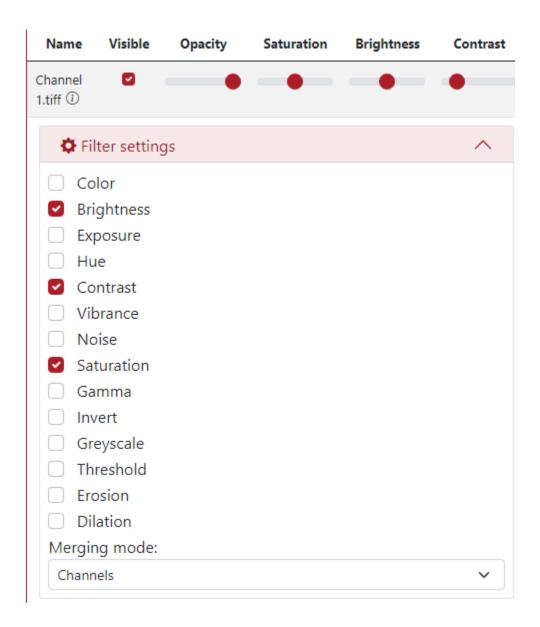

2.1. Images 7

2.1.3 Apply filters

You can apply several filters to the images. The ones we can be adjusted by default are saturation, brightness, and contrast. Additionally, when opening the Filter settings menu, there are various other filters, such as exposure, noise, erosion, etc. When you check their box, they are automatically added to the filter panel above. The filter's sliders can be adjusted so that the filter is applied at the desired intensity. Another option in filter settings is merging mode (bottom part), where you can merge the channels as a composite.

2.1. Images 8

2.2 Markers

2.2.1 Supported marker format

TissUUmaps can read CSV (Comma Separated Values) files with a header row, and at least spatial coordinate columns (X and Y). CSV files are not limited in the number of columns or number of rows. Other columns can contain information for displaying markers (key to group markers, color, size, shape, piecharts, etc.)

CSV files can be exported from any spreadsheet program, or any programming language (Python, R, etc.)

2.2.2 Load markers

You can load the markers when you select the Markers tab and click the button + as you can see in the figure below. You can click the plus several times to load various marker files.

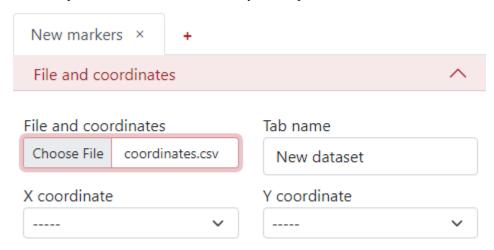

2.2.3 Markers settings

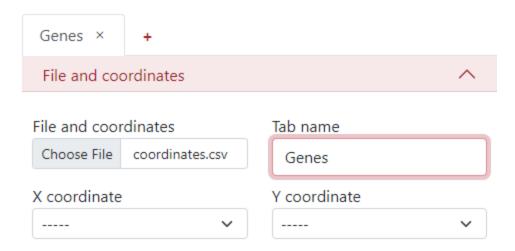

Before the markers are displayed you have to set up the markers settings.

File and coordinates

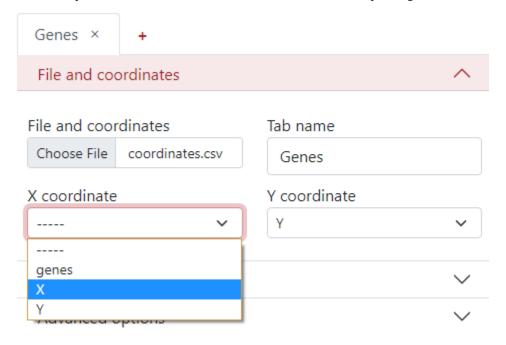

The first step is to select the desired file from your computer under the tab File and coordinates - Choose file.

You can change the Tab name to the desired name, so it is easier to navigate between them when there are more tabs.

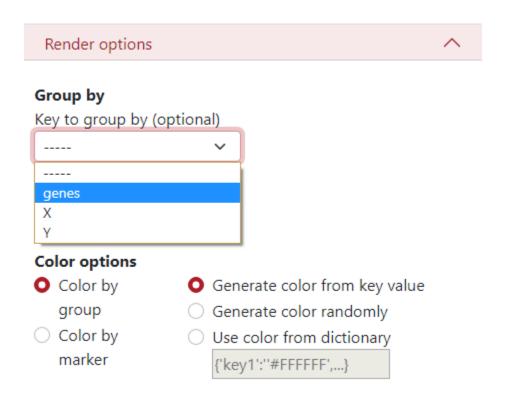

The next step is to select the column names from the .csv file corresponding to the X and Y coordinates.

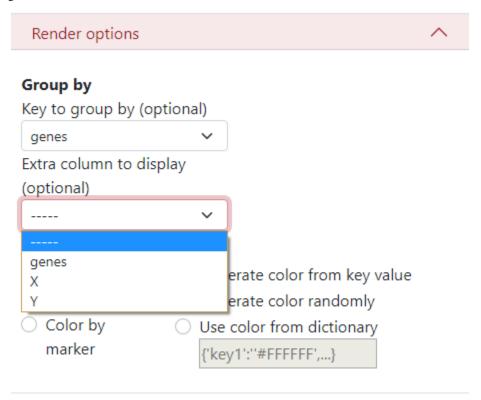

Render options

Here, you can define a key to group by, what is a column from the .csv file which will be used to display the dataset grouped by different colors and shapes of the markers. In this example, we use the column genes, where different colors and shapes of markers represent different genes.

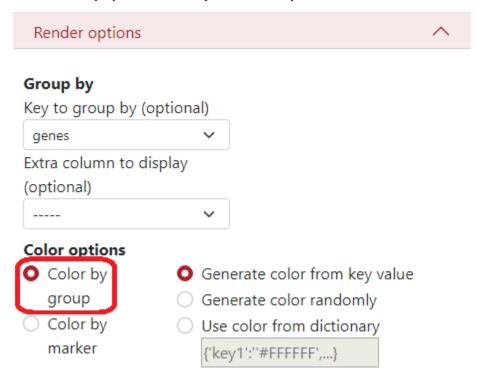

There is an option to display an extra column, for example when the data are clustered but you want to see the original genes and also the cluster names.

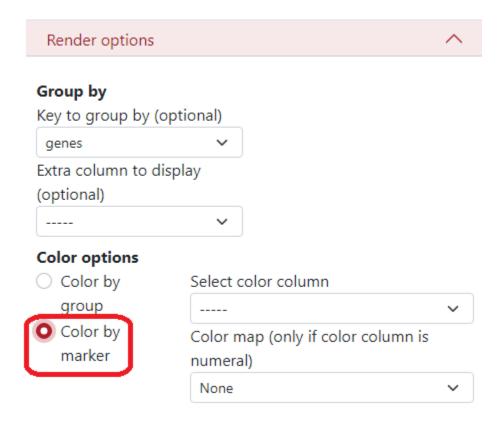

In Color options, you can select to color by groups where each group has a different color. Then on the right side, you can select the color palette:

- Key value Colors are generated from the name of the group (first 4 letters). Groups starting with the same letter have similar colors.
- Randomly Colors are generated randomly.
- Dictionary you can insert a specific dictionary in the text area which will be used for generating the colors.

If you want to color by markers, you have to select the column from the .csv file which will be used to create the colors, and the colormap, but only if the color column is numeral.

Advanced options

Table of markers

2.3 Regions

2.3.1 Supported region formats

TissUUmaps can read and write region files in the GeoJSON format.

Only a subset of the GeoJSON format is supported, as TissUUmaps uses only polygonal regions:

Main types:

- Feature
- FeatureCollection
- GeometryCollection

Geometries:

- Polygon
- Multipolygon

The coordinate system must be the same as the image and marker coordinate systems.

2.3. Regions 14

- 2.3.2 Draw Regions
- 2.3.3 Analyze Regions
- 2.3.4 Load Regions
- 2.3.5 Export Regions

2.4 Projects

2.4.1 Saving and loading projects

For more information on the tmap file format and specifications, see *The TMAP file format*.

2.5 Exporting screenshots

TissUUmaps allows high resolution capture of the image viewport. Go to Menu > File > Capture viewport and chose a zoom factor for export (1 = screen resolution).

The screen capture will contain all filtered layers, markers, and regions. Note that legends will not be part of the export and must be added manually.

2.6 Plugins

2.6.1 Load plugins

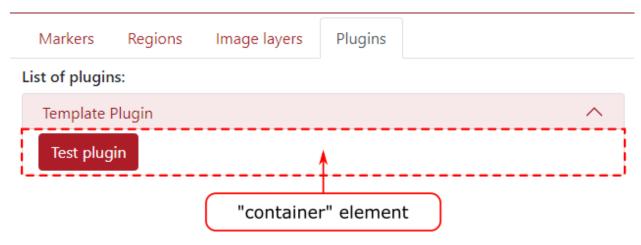

2.6.2 Make your own plugin

Download the Plugin Template python and javascript files from the Plugin Update Site and put both files in your local folder \$USER_PATH/.tissuumaps/plugins/. You can then change the plugin name and add your own options and functions.

Javascript file

When loading a plugin, the function PluginName.init(container) will be called. The container is an html Element that will be added to the plugin menu. Use this element to add options and texts related to your plugin.

2.4. Projects 15

Here is a minimal example of plugin:

```
var Plugin_template;
Plugin_template = {
    name:"Template Plugin"
}

/**
    * This method is called when the document is loaded.
    * The container element is a div where the plugin options will be displayed. */
Plugin_template.init = function (container) {
    container.innerHTML = "Hello world";
}
```

You can access the TissUUmaps javascript API here.

Python file

You only need to use the Python file if your plugin needs to do processing on the server side. For pure javascript plugins, you can leave this file empty.

The python file should implement the class Plugin:

```
class Plugin ():
    def __init__(self, app):
        self.app = app
```

The app object being the flask application running the TissUUmaps server.

You can call a Python method inside the Plugin class from Javascript using Ajax and the Python API. The endpoint for a method methodName of the plugin PluginName will be: /plugins/methodName/functionName. Data can be transmitted through Ajax as stringified JSON, and will be available as a parameter inside the method.

See the Plugin Template for a working example of Javascript / Python communication.

2.6. Plugins 16

CHAPTER

THREE

SHARING PROJECTS

3.1 Apache server

TissUUmaps projects can be exported into static webpages, that can be uploaded to any Apache server.

- 1. Save your project from TissUUmaps (menu > File > Save project)
- 2. Export to static page (menu > File > Export to static webpage)
- 3. Copy the exported folder on your Apache server

3.2 Docker container

1. Start the docker container cavenel/tissuumaps:latest from Docker Hub:

```
docker run -it -p 56733:80 --name=tissuumaps -v /path/to/local/images:/mnt/data cavenel/\rightarrowtissuumaps:latest
```

- 1. Place your images in the local folder /path/to/local/images/share.
- 2. Open http://127.0.0.1:56733/ in your favorite browser.

CHAPTER

FOUR

ADVANCED USAGE

4.1 Jupyter notebooks

TissUUmaps can easily be used inside a Jupyter Notebook or Jupyter Lab.

Simple example to load an image in TissUUmaps:

```
import tissuumaps.jupyter as tj
viewer = tj.loaddata(["image.png"])
viewer.screenshot()
```

4.1.1 tissuumaps.jupyter

Module used to run TissUUmaps from a Jupyter Notebook or from Jupyter Lab.

```
tissuumaps.jupyter.opentmap(path, port=5100, host='localhost', height=700)
Open a tmap project
```

Parameters

- **path** (*str*) The path to a tmap file
- port (int) The port to run the TissUUmaps server
- **host** (*str*) The host to run the TissUUmaps server
- **height** (*int*) The height of the jupyter iframe

Returns The TissUUmaps viewer

Return type TissUUmapsViewer

```
tissuumaps.jupyter.loaddata(images=[], csvFiles=[], xSelector='x', ySelector='y', keySelector=None, nameSelector=None, colorSelector=None, piechartSelector=None, shapeSelector=None, scaleSelector=None, fixedShape=None, scaleFactor=1, colormap=None, compositeMode='source-over', boundingBox=None, port=5100, host='localhost', height=700, tmapFilename='_project', plugins=[])
```

Load data in TissUUmaps

Parameters

- **images** (*list | str*) List of images or single image to display
- csvFiles (list | str) List of csv files or single csv file to display

- **xSelector** (*str*) Name of the csv column defining the X coordinates
- **ySelector** (*str*) Name of the csv column defining the Y coordinates
- **keySelector** (*str*) Name of the csv column defining the grouping key
- nameSelector (str) Name of the csv column defining the group name
- **colorSelector** (*str*) Name of the csv column defining the group color
- piechartSelector (str) Name of the csv column defining pie-charts
- **shapeSelector** (*str*) Name of the csv column defining markers' shape
- scaleSelector (str) Name of the csv column defining markers' scale
- **fixedShape** (*int*) Name of the markers' shape
- **scaleFactor** (*int*) Global scale of markers
- colormap (str) Name of the colormap used if colorSelector is set
- **compositeMode** (str): Composite mode used for images
- **boundingBox** (1ist) [X,Y,W,H] of the bounding box to display
- port (int) The port to run the TissUUmaps server
- **host** (*str*) The host to run the TissUUmaps server
- **height** (*int*) The height of the jupyter iframe
- **tmapFilename** (*str*) Name of the project file that will be created
- **plugins** (list) List of plugins to add to the tmap project

Returns The TissUUmaps viewer

Return type TissUUmapsViewer

class tissuumaps.jupyter.TissUUmapsViewer(server, image, height=700)

Class representing a TissUUmaps viewer instance

screenshot()

Capture the TissUUmaps viewport and display image in the Notebook.

class tissuumaps.jupyter.TissUUmapsServer(slideDir, port=5000, host='0.0.0.0')

Class representing a TissUUmaps server instance

4.2 Napari

Napari features an important hub containing 118 plugins at the time of writing, many of them expanding further the capabilities of Napari when dealing with biomedical imaging. We thus created our own plugin to allow users to work in Napari, benefit from the tools, scripting and existing plugins, and easily visualize and share the output of their research through TissUUmaps.

The Napari-TissUUmaps plugin is available on Napari Hub which makes the installation trivial: from the Napari install/uninstall plugins menu, the napari-tissuumaps appears in the list and can be installed with a single click. Alternatively, the plugin can be installed with the Python package manager: pip install napari-tissuumaps.

The plugin can export all standard Napari layers, such as images, labels, points, and shapes and preserves the metadata (opacity, visibility), but also the objects parameters (e.g.: label colors, marker colors and symbols, etc...). To export a TissUUmaps project, care must be taken to save all layers of interest and type in a name with the extension .tmap, e.g.: myProject.tmap. This is important for Napari to delegate the saving of the files to the plugin. A folder is created

4.2. Napari 19

and contains all the necessary files and can be loaded in the TissUUmaps server, software, Jupyter Notebook, or shared with the community.

The project folders generated by the plugin contain the metadata in a main.tmap file, along with folders for each Napari layer types: images, labels, points and regions. Images and labels are saved as plain tif images, points are saved as CSV files, and shapes are saved as GeoJSON. We hope that the use of a simple structure and widespread file formats can simplify the modifying and updating of the TissUUmaps project when prototyping with e.g. Jupyter Notebooks. The source code is available at https://github.com/TissUUmaps/napari-tissuumaps under the permissive MIT license. A demonstration of the Cellpose plugin of Napari being exported to the TissUUmaps web viewer is available at: https://tissuumaps.github.io/tutorials/#napari.

4.3 AnnData

Work in progress

4.4 The TMAP file format

The TMAP format contains a description of image layers, markers, regions, and settings. It is highly recommended to create .tmap files by saving projects from TissUUmaps, but you can also edit the files manually to add or change projects' settings, or generate them as exported data from other software for import in TissUUmaps.

The TMAP format uses JSON, with the following specifications:

4.4.1 TMAP project specifications

Description of image layer	ers, markers, regions, and s	ettings of a project. Requ	ired properties are shown in bold text	
type	object			
properties	•			
• filename	Name of the project			
	type	string		
• layers	type	array

text			
type	array		
items	·		
•	type	object	
	properties		
	• name	Filter name. See	Filter for more details.
		type	string
	• value	Filter parameter. See <i>Filter</i> for more details.	
		type	string

Filter

TissUUmaps supports most filters available in OpenSeadragon via the https://github.com/usnistgov/		
OpenSeadragonFiltering plugin.		
enum	Color, Brightness, Exposure, Hue, Contrast, Vibrance, Noise, Saturation,	
	Gamma, Invert, Greyscale, Threshold, Erosion, Dilation	

ColorScale

TissUUmaps supp	ports most of the color scales available in the D3.js library. See https://github.com/d3/		
d3-scale-chromati	d3-scale-chromatic for reference. Note: the colors for 'interpolateRainbow' are currently overridden by a custom		
Turbo-like color so	cale in version 3.0.x of TissUUmaps.		
enum	interpolateCubehelixDefault, interpolateRainbow, interpolateWarm, interpolateCool, interpo-		
	lateViridis, interpolateMagma, interpolateInferno, interpolatePlasma, interpolateBlues, inter-		
	polateBrBG, interpolateBuGn, interpolateBuPu, interpolateCividis, interpolateGnBu, inter-		
	polateGreens, interpolateGreys, interpolateOrRd, interpolateOranges, interpolatePRGn, inter-		
	polatePiYG, interpolatePuBu, interpolatePuBuGn, interpolatePuOr, interpolatePuRd, interpo-		
	latePurples, interpolateRdBu, interpolateRdGy, interpolateRdPu, interpolateRdYlBu, interpo-		
	lateRdYlGn, interpolateReds, interpolateSinebow, interpolateSpectral, interpolateTurbo, inter-		
	polateYlGn, interpolateYlGnBu, interpolateYlOrBr, interpolateYlOrRd		

Shape

TissUUmaps supports most of the marker shapes that are also used by the Napari software, https://napari.org. In		
addition to the name strings listed below, shape can also be specified by a corresponding index in range 0-13.		
enum	cross, diamond, square, triangle up, star, clobber, disc,	
	hbar, vbar, tailed arrow, triangle down, ring, x, arrow	

MarkerFile

ype	object			
roperties				
• title	Name of marker button			
titic	type	string		
• comment		Optional description text shown next to marker button		
Comment	type	string

Table 2 – continued from previous page

	type	string
	default	1
tooltip_fmt	Custom formatting string used for displaying metadata about a selected marker. See https://github.com/TissUUmaps/TissUUmaps/issues/2 for an overview of the grammer and keywords. If no string is specified, TissU-	
	Umaps will show default metadata depending on the context.	
	type	string
	default	

ExpectedRadios

type	object		
properties	·		
• cb_col	If markers should be cold	If markers should be colored by data in CSV column	
	type	boolean	
	default	false	
• cb_gr	If markers should be cold	If markers should be colored by group	
	type	boolean	
	default	true	
• cb_gr_rand	If group color should be	If group color should be generated randomly	
	type	boolean	
	default	false	
• cb_gr_dict	If group color should be	If group color should be read from custom dictionary	
	type	boolean	
	default	false	
• cb_gr_key		If group color should be generated from group key	
	type	boolean	
	default	true	
• pie_check		If markers should be rendered as pie charts	
· pic_cneck	type	boolean	
	default	false	
scale_check		If markers should be scaled by data in CSV column	
Scale_check	type	boolean	
	default	false	
• shape_col		If markers should get their shape from data in CSV column	
Shape_coi	type	boolean	
	default	false	
• shape_gr		If markers should get their shape from group	
• snape_gi	type	boolean	
	default	true	
shape_gr_rand	I	If group shape should be generated randomly	
shape_gr_rand	type	boolean	
	default	true	
• shape_gr_dict	2. 2. 2. 2. 2.	If group shape should be read from custom dictionary	
• snape_gr_dict	type	boolean	
	default	false	
shape_fixed	2. 2. 2. 2. 2.	If a single fixed shape should be used for all markers	
- snape_nxeu	type	boolean	
	default	false	

Table 3 – continued from previous page

opacity_check	If markers should get their opacities from data in CSV column		
	type	boolean	
	default	false	
• _no_outline	If marker shapes should be rendered without outline		
	type	boolean	
	default	false	

RegionFile

Description of settings and a	regions loaded from GeoJSON file	e. Required properties are shown in bold text.	
type	object	object	
properties			
• title	Name of region button	Name of region button	
	type	string	
 comment 	Optional description te	Optional description text shown next to region button	
	type	string	
	default		
 autoLoad 	If the regions should be	If the regions should be automatically loaded when the TMAP project is	
	opened. If this is false,	opened. If this is false, the user instead has to click on the region button in	
	the GUI to load the reg	the GUI to load the regions.	
	type	boolean	
	default	false	
• path	Relative file path to Ge	Relative file path to GeoJSON file in which marker data is stored. If array	
	of string, then a dropdo	of string, then a dropdown is created instead of a button.	
	type	string / array	
• settings	type	array	
	default	[]	
	items	items	
	•	Setting	

Setting

Advanced javascript setting, used to change the value of a property in a module, or to call a function in a module.					
If module.function is a function, then calls module.function(value), else affects value to module.function.					
Required properties are shown in bold text.					
type	object				
properties					
• module	Module where the function or property lies.				
	type	string			
• function	Function or property of the given module.				
	type	string			
• value	type	number
